Quiz Instructions

Based on video 11/30/22

Question 1 8.5 pts

From our Earth's perspective, farther galaxies move

☐

at the same speed

☐

faster

☐

don't move

☐

slower

Question 2 8.5 pts

The expansion rate of the Universe is

☐

different in different directions.

☐

decreasing.

☐

increasing.

☐

constant.

☐

independent of time.

Question 3 8.5 pts

The afterglow of the big bang is now in the _____ range

microwave

Ultra violet

Infra red

visible light

Question 4 8.5 pts

The redshift of the galaxies is correctly interpreted as

a Doppler shift due to the random motions of galaxies in space.

an aging of light as gravity weakens with time.

space itself is expanding with time, so the photons are stretched while they travel through space.

placing our Galaxy near the center of the Local Group.

the differences in temperatures and star formation in old and young galaxies.

Question 5 8.5 pts

What is the Big Bang?

The creation of the primeval fireball.

An explosion that spewed matter all over the universe.

The event that started the expansion of the universe.

The creation of matter and the universe.

An enormous explosion that organized all matter in the universe.

Question 6 8.5 pts

The big bang started with an

stagnation

compression

variation

inflation

Question 7 8.5 pts

What does the Hubble law imply about the history of the universe?

The Milky Way lies exactly at the center of this expansion.

The red shifts will turn to blue shifts as universe contraction follows the expansion.

The universe must be infinitely old and huge.

The red shifts will lengthen with time due to dark energy.

The universe had a beginning and has expanded since, giving it a finite age.

Question 8 8.5 pts

The milky way belongs to the

far away kingdom

the virgo cluster

local group

strange group

Question 9 8.5 pts

Which element was formed early in the Universe history

C

H

He

Question 10 8.5 pts

The universe, on a large scale, looks like

a spider web

a tunnel

bubbles

huge black hole

Question 11 8.5 pts

The center of the universe

is Earth.

does not exist anywhere in space.

is where the Big Bang happened.

is the Milky Way.

is the Sun.

Question 12 8.5 pts

The presently accepted value of the Hubble constant gives an age of

4.5 billion years.

18 billion years.

22 billion years.

8-9 billion years.

14 billion years.
